a
b
c
unregularized optimum
prior (dotted: its tilt)
$N(0, 1/4)$
$N(0, 1)$
$N(0, 4)$
$N(2, 1)$
tilt $\int \chi \, d\mu^*$ of the minimizer
κ
stopped utility U
prior policy π_Γ
minimizers, κ decreasing
μ_0 (plateau)
geometric risk q_β (%)
$|q_\beta(\mu^*) - q_\beta(\pi_\Gamma)|$
risk is at most one
risk slack bound
