a
deviation
number of units n
deviation of the geometric risk
ε_n of the transfer theorem
b
deviation
number of units n
clipped value
continuing value
stopped utility
bound for the clipped value
bound for value and utility
c
deviation
number of units n
deviation of the risk through $T = 10$
direct horizon bound
d
relative entropy through T
number of units n
mean
90% quantile
$(T+1)L_0^2/(2n)$
$(T+1)L_0^2/(2n\zeta)$
